

Interventional Radiology - Terms, Techniques and Teamwork

Sean Walker, MD

Objectives:

- 1. Provide an overview of interventional radiology procedures defining commonly used and important vocabulary including embolization, ablation, angioplasty, stenting, aneurysm, etc (as well as associated terms such as radioembolization, chemoembolization, thermal and cryoablation, etc).** - *This first section will be directed towards radiologic technology students.*
- 2. Illustrate intraprocedural practical strategies and techniques helpful to the interventional radiology technologist using a case based approach.** - *The second section will be directed towards currently practicing interventional radiologic technologists and those students particularly interested in pursuing an interventional radiology career track.*
- 3. Demonstrate through a case based approach how effective teamwork is essential to providing the highest quality care in the interventional radiology department.** - *While hopefully interesting for the entire audience, this last section will be directed to practicing interventional radiologic technologists, especially those in leadership positions or pursuing leadership positions within their department.*
